

What is JavaScript & What Can It Do? JavaScripts History JavaScript was introduced by Netscape in their Navigator browser back in 1996 JavaScript that is supported by your browser contains language features not included in the current ECMAScript specification and missing certain language features from that specification The latest version of ECMAScript is the Sixth Edition (generally referred to as ES6 or ES2015).

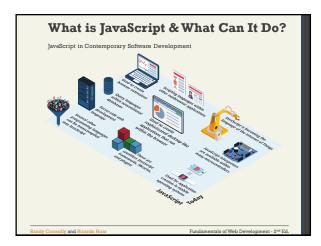

What is JavaScript & What Can It Do?

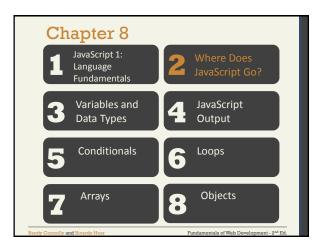

JavaScript and Web 2.0

- Early JavaScript had only a few common uses:
- 2000s onward saw more sophisticated uses for JavaScript
- AJAX as both an acronym and a general term
- Chapters 10 and 19 will cover AJAX in much more detail.

Randy Connolly and Ricardo Hoar

Fundamentals of Web Development - 2nd Ed

Inline JavaScript				
Inline JavaScript refers to the practice of				
code directly within certain HTML attribut	tes			
mo	ore info			
<input onclick="alert('Are</td><td>you sure?');" type="button"/>	_			
		_

Where Does Java	Script Go?			
external JavaScript files typically contain data definitions, and entire frameworks.	function definitions,			
<head></head>				
<pre><head> <script src="gr</pre></td><td>reeting.js" type="text/javascript"></script></head></pre>	_			
	reeting.js">			

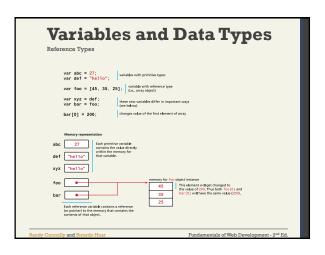

Where Does JavaScript Go? Users without JavaScript Web crawler Browser plug-in. Text-based client. Visually disabled client. The <NoScript> Tag

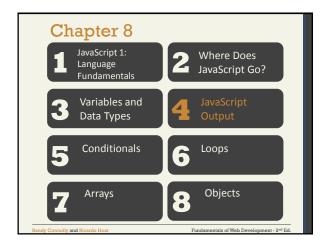

Chapter 8	
JavaScript 1: Language Fundamentals	Where Does JavaScript Go?
Variables and Data Types	JavaScript Output
5 Conditionals	6 Loops
7 Arrays	8 Objects

Variables and Data Types Variables in JavaScript are dynamically typed This simplifies variable declarations, since we do not require the familiar data-type identifiers Instead we simply use the var keyword

Variables and Data Types Example variable declarations and Assignments	
Defines a variable named abc	
var abc; Each line of JavaScript should be terminated with a semicolon	
var def = 0; A variable named def is defined and initialized to 0	
def = 4 ;	
<pre>def = "hello";</pre>	
Notice that a line of JavaScript can span multiple lines	
Randy Connolly and Ricardo Hoar Fundamentals of Web Development - 2nd Ed.	

Variables and Data Types two basic data types: reference types (usually referred to as objects) and primitive types Primitive types represent simple forms of data. Boolean, Number, String, ...

JavaScript Output alert("Hello world"); Randy Connolly and Ricardo Hoar Fundamentals of Web Development - 2nd Ed.

JavaScript Output	
var name = "Randy";	
document.write(" <h1>Title<td>1>");</td></h1>	1>");
// this uses the concatenate ope	erator (+)
document.write("Hello " + nam	e + " and welcome");
Connolly and Ricardo Hoar	Fundamentals of Web Development - 2 nd E

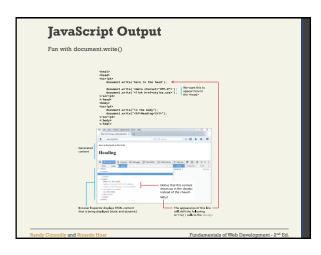

JavaScript Output

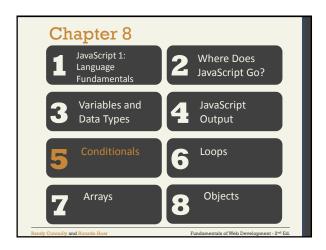

- alert() Displays content within a pop-up box.
- console.log() Displays content in the Browser's JavaScript console.
- document.write() Outputs the content (as markup) directly to the HTML document.

```
Conditionals

If, else if, else

if (hourOfDay > 4 && hourOfDay < 12) {
    greeting = "Good Morning";
  }

else if (hourOfDay >= 12 && hourOfDay < 18) {
    greeting = "Good Afternoon";
  }

else {
    greeting = "Good Evening";
  }

Randy Connolly and Ricardo Hoar

Fundamentals of Web Development - 2<sup>nd</sup> Ed.
```

```
Conditionals

switch

switch (artType) {

    case "PT":

        output = "Painting";

        break;

    case "SC":

        output = "Sculpture";

        break;

    default:

    output = "Other";

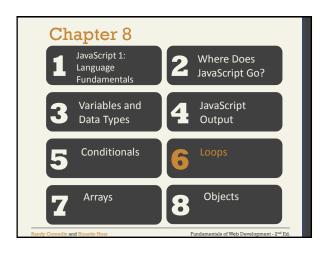

}

Randy Connolly and Bicardo Hoar

Fundamentals of Web Development - 2<sup>nd</sup> Ed.
```

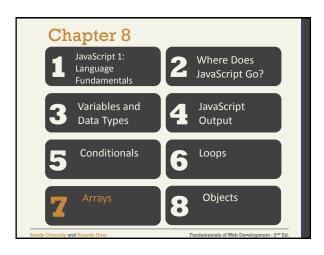

Conditionals	
Conditional Assignment	
	/ not 4";

Conditionals Truthy and Falsy In JavaScript, a value is said to be truthy if it translates to true, while a value is said to be falsy if it translates to false. • Almost all values in JavaScript are truthy • false, null, "", ", 0, NaN, and undefined are falsy

```
ILOOPS
For Loops

initialization condition post-loop operation
for (var i = 0; i < 10; i++) {
// do something with i
// ...
}
```

Arrays

Arrays are one of the most commonly used data structures in programming.

JavaScript provides two main ways to define an array.

- object literal notation
- use the Array() constructor

Randy Connolly and Ricardo Hoar

Fundamentals of Web Development - 2nd Ed

Arrays

object literal notation

The literal notation approach is generally preferred since it involves less typing, is more readable, and executes a little bit quicker

var years = [1855, 1648, 1420];

var countries = ["Canada", "France",

"Germany", "Nigeria",

"Thailand", "United States"];

var mess = [53, "Canada", true, 1420];

Randy Connolly and Ricardo Hoar

Fundamentals of Web Development - 2nd Ed.

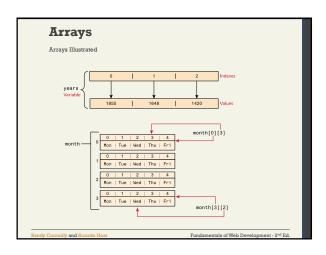

Arrays

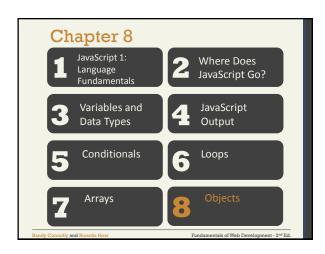

Some common features

- arrays in JavaScript are zero indexed
- [] notation for access
- .length gives the length of the array
- .push()
- .pop()
- concat(), slice(), join(), reverse(), shift(), and sort()

Randy Connolly and Ricardo Hoar

Fundamentals of Web Development - 2nd Ed

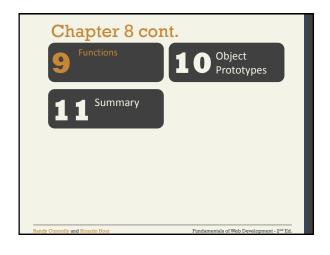

```
Objects
Object Creation—Object Literal Notation

var objName = {
    name1: value1,
    name2: value2,
    // ...
    nameN: valueN
};
```

Object Creation—Object Literal Notation	on.
,	
Access using either of:	
 objName.name1 	
 objName["name1"] 	

Objects
Object Creation—Constructed Form

// first create an empty object
var objName = new Object();
// then define properties for this object
objName.name1 = value1;
objName.name2 = value2;

Functions

Function Declarations vs. Function Expressions

Functions are the building block for modular code in JavaScript.

 $\textbf{function} \ \text{subtotal(price,quantity)} \ \{$

return price * quantity;

}

The above is formally called a **function declaration**, called or invoked by using the () operator

var result = subtotal(10,2);

Donate Connelle and Discorde House

Fundamentals of Web Development - 2nd Ed

Functions

Function Declarations vs. Function Expressions

// defines a function using a function expression

var sub = function subtotal(price,quantity) {

return price * quantity;

};

// invokes the function

var result = sub(10,2);

It is conventional to leave out the function name in function expressions

Randy Connolly and Ricardo Hoar

undamentals of Web Development - 2nd Ed

Functions

Anonymous Function Expressions

 $\ensuremath{/\!/}$ defines a function using an anonymous function expression

var calculateSubtotal = function (price,quantity) {

return price * quantity;

};

// invokes the function

var result = calculateSubtotal(10,2);

Randy Connolly and Ricardo Hoar

Fundamentals of Web Development - 2nd Ed

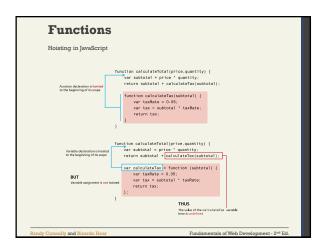

```
Functions

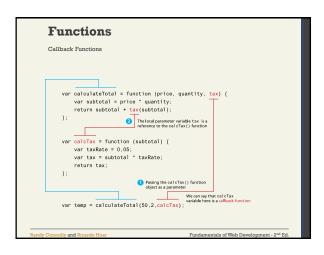

Nested Functions

function calculateTotal(price,quantity) {
    var subtotal = price * quantity;
    return subtotal + calculateTax(subtotal);
    // this function is nested
    function calculateTax(subtotal) {
        var taxRate = 0.05;
        var tax = subtotal * taxRate;
        return tax;
    }
}

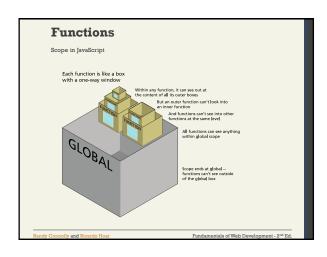

Randy Connolly and Ricardo Hoar

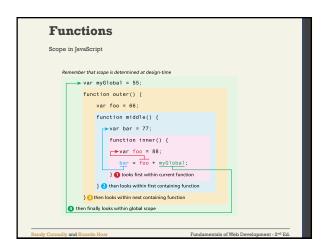

Fundamentals of Web Development - 2<sup>nd</sup> Ed.
```

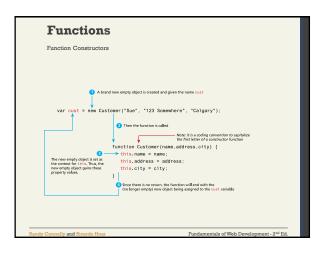

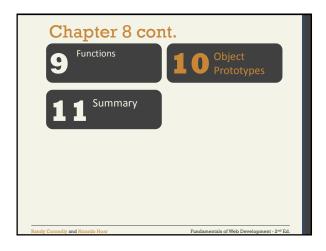

Callback Functions	
Campack runctions	
	Passing an anonymous function definition as a callback function parameter
var temp = calculateT	
	function (subtotal) {
	<pre>var taxRate = 0.05; var tax = subtotal * taxRate;</pre>
	return tax;
	}
); [

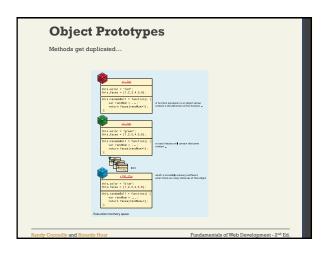

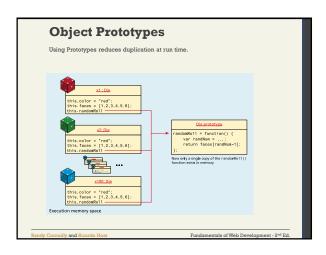

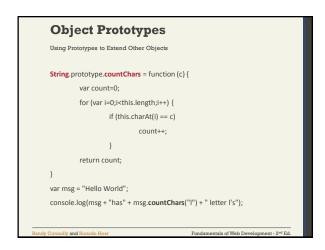

Object Prototypes There's a better way While the constructor function is simple to use, it can be an inefficient approach for objects that contain methods. Prototypes are an essential syntax mechanism in JavaScript, and are used to make JavaScript behave more like an object-oriented language.

Summary		
Key Terms		
ActionScript	ES2015	libraries
Adobe Flash	ES6	loop control variable
anonymous functions	exception	method
assignment	expressions	minification
AJAX	external JavaScript files	module pattern
applet	falsy	namespace conflict
arrays	fail-safe design	problem
arrow functions	for loops	objects
associative arrays	functions	object literal notation
browser extension	function constructor	primitive types
browser plug-in	function declaration	property
built-in objects	function expression	prototypes
callback function	inline JavaScript	reference types
client-side scripting	immediately-invoked	scope (local and global)
closure	function	strict mode
conditional assignment	Java applet	throw
dot notation	JavaScript frameworks	truthy
dynamically typed	JavaScript Object Notation	try catch block
ECMAScript	JSON	undefined
embedded JavaScript	lexical scope	variables
